the 1990s, the number of people in the world who are undernourished has increased from 250 million to 800 million.

There are a number of reasons why the world's population is becoming more undernourished. One of the main reasons is that the world's population is growing very rapidly. In 1990, there were about 5.3 billion people in the world. By 2000, there were about 6.1 billion people in the world. By 2010, there are expected to be about 6.9 billion people in the world. This means that there are about 1.6 billion more people in the world than there were in 1990.

Another reason why the world's population is becoming more undernourished is that the world's food supply is not keeping pace with the world's population growth. In 1990, the world's food supply was about 2.5 billion tonnes. By 2000, the world's food supply was about 2.8 billion tonnes. By 2010, the world's food supply is expected to be about 3.1 billion tonnes.

However, the world's population is growing much faster than the world's food supply. This means that the world's food supply is not keeping pace with the world's population growth. As a result, the world's population is becoming more undernourished.

There are a number of ways in which the world's food supply can be increased. One way is to increase the amount of land that is used for agriculture. Another way is to increase the amount of food that is produced on the same amount of land. A third way is to reduce the amount of food that is wasted.

There are a number of ways in which the world's population can be reduced. One way is to reduce the birth rate. Another way is to increase the death rate. A third way is to increase the life expectancy.

There are a number of ways in which the world's population can be managed. One way is to reduce the birth rate. Another way is to increase the death rate. A third way is to increase the life expectancy.
